Google Calendar Phase 3

By: Kyle, Emilee, Joseph, Montana, Mallory
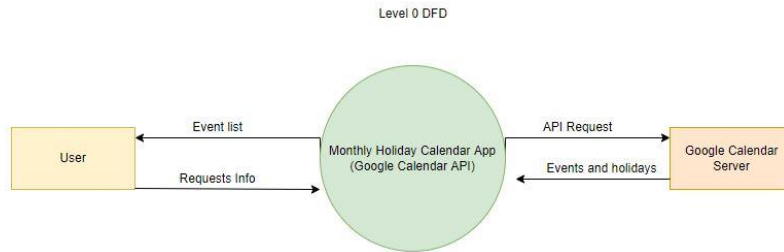

Final Interface of system

In the final interface we made some changes. We removed some features we won't be able to get to like the add event button. Overall we simplified the system as well as keeping it consistent.

Login Window

The login window will now open the Read-Me file that contains information on the app and it's developers. Clicking the login button will now open the main window for the calendar app, where the user is currently able to access a calendar and view any holidays or important events that it contains.

Structure/Architecture of server side

After the user makes an API request to the server, the server will respond by sending a package of data containing the requested data to the user. The data will then be displayed to the user via the GUI.
